Projects

Cortex – Distributed Observability and Root Cause Platform — GitHub	Jul 2026 – Present
– Built a distributed observability platform using React, Node.js, PostgreSQL, and Socket.io to monitor latency and failures across 10 microservices, streaming telemetry at 3-second intervals. – Implemented request correlation, tracing, and dependency analysis to identify root causes across 11 simulated failure scenarios. – Developed an ML + RAG remediation pipeline by training 3 XGBoost models on 200K+ simulated telemetry records and integrating pgvector-based retrieval to generate context-aware recovery guidance.	
MiniDB – Lightweight SQL Engine with Time-Travel Queries — GitHub	Jun 2026
– Built a lightweight SQL engine from scratch in C++ supporting 10 SQL-like commands, including CRUD operations, WHERE filtering, indexing, pagination, HISTORY, and ROLLBACK. – Designed an incremental versioning mechanism enabling efficient retrieval and restoration of previous database states. – Implemented query parsing and execution using custom data structures and file-based storage.
